

PolloCoin (POLLO)

WHITEPAPER • VERSION 1.0

A community-driven marketing token built on the Polygon network to support the Fides ecosystem.

1. Introduction

PolloCoin (POLLO) is a meme token deployed on the Polygon network. It was created as a marketing and community-building product to support **Fides Token** and **Fides Exchange Holdings LLC**, and it is offered as a product of that company.

PolloCoin has no promise of price appreciation, profit, dividends, or return of any kind. It is a community and marketing token, and holding it does not represent equity, a security, or any ownership stake in Fides Exchange Holdings LLC or any of its affiliates.

2. Purpose

The primary purpose of PolloCoin is to:

- Serve as a fun, easy-to-adopt entry point into the broader **Fides** ecosystem.
- Act as a marketing and advertising vehicle to raise awareness of Fides Token and Fides Exchange Holdings LLC.
- Help grow and engage the Fides community by giving it a lighthearted, shareable asset.

PolloCoin is not intended to function as a utility token, a governance token, or a store of value in itself. Its value, if any, is driven entirely by community adoption and market interest, not by underlying cash flows, revenue share, or contractual rights.

3. Token Details

Parameter	Value
Token Name	Pollocoin
Symbol	POLLO
Blockchain	Polygon (Chain ID 137)
Token Standard	ERC-20
Total Supply	1,000,000,000 POLLO
Supply Model	Fixed — minted once at deployment, no further minting function exists
Decimals	18
Contract Address	0x7ed8C41dB53f3337ff0b1B0E84e48FDF32B4847C

The full supply was minted at deployment directly to a treasury address. There is no minting function in the contract, meaning the total supply of 1,000,000,000 POLLO can never be increased.

4. Smart Contract Features

The PolloCoin contract is built on audited, widely-used OpenZeppelin v5 building blocks:

- **ERC20 / ERC20Burnable** — standard transfer functionality, plus the ability for any holder to voluntarily burn their own tokens, permanently reducing supply.
- **ERC20Pausable** — allows the contract owner to pause and unpause all token transfers, intended strictly as an emergency safety mechanism (e.g., in the event of a discovered vulnerability).
- **Ownable** — defines a privileged owner role for administrative functions.
- **ReentrancyGuard** — protects state-changing functions from reentrancy attacks.
- **Recovery functions** — allow the owner to recover other ERC-20 tokens or native POL accidentally sent to the contract address. These functions explicitly cannot be used to withdraw or recover POLLO itself, closing off any possibility of the owner draining the community's tokens through this mechanism.

5. Governance & Security

To reduce single-point-of-failure risk, ownership of the PolloCoin contract has been transferred from a single wallet to a **2-of-3 multisignature wallet (Safe)**, deployed on Polygon at:

```
0xb61a908401a68f60C403675995b42089ccb70D57
```

Any privileged action on the contract now requires confirmation from at least two of the three designated signers. As the project matures, the team intends to evaluate renouncing ownership entirely.

6. Relationship to Fides

PolloCoin is a product of Fides Exchange Holdings LLC and exists to support the visibility and community growth of Fides Token and the broader Fides ecosystem. It is a marketing initiative first and foremost.

7. Risks & Disclaimer

- Meme token with no intrinsic utility, revenue backing, or guaranteed value.
- Assets are highly volatile and speculative. Engage only with funds you can afford to lose.
- Does not constitute financial, investment, legal, or tax advice.
- Smart contracts carry inherent technical risk. No absolute security warranty is made.
